01. Date of notification

2025-10-06

02. Statement in accordance with Article 6(3) of Regulation (EU) 2023/1114

This crypto-asset white paper has not been approved by any competent authority in any Member State of the European Union. The person seeking admission to trading of the crypto-asset is solely responsible for the content of this crypto-asset white paper.

03. Compliance statement in accordance with Article 6(6) of Regulation (EU) 2023/1114

This crypto-asset white paper complies with Title II of Regulation (EU) 2023/1114 of the European Parliament and of the Council and, to the best of the knowledge of the management body, the information presented in the crypto-asset white paper is fair, clear and not misleading and the crypto-asset white paper makes no omission likely to affect its import.

04. Statement in accordance with Article 6(5), points (a), (b), (c), of Regulation (EU) 2023/1114

The crypto-asset referred to in this crypto-asset white paper may lose its value in part or in full, may not always be transferable and may not be liquid.

05. Statement in accordance with Article 6(5), point (d), of Regulation (EU) 2023/1114

Since the token has multiple functions (hybrid token), these are already conceptually not utility tokens within the meaning of the MiCAR within the definition of Article 3, 1. (9), due to the necessity "exclusively" being intended to provide access to a good or a service supplied by its issuer only.

FFG: G6QFN3Z7F - 2025-10-06

06. Statement in accordance with Article 6(5), points (e) and (f), of Regulation (EU) 2023/1114

The crypto-asset referred to in this white paper is not covered by the investor compensation schemes under Directive 97/9/EC of the European Parliament and of the Council or the deposit guarantee schemes under Directive 2014/49/EU of the European Parliament and of the Council.

Summary

07. Warning in accordance with Article 6(7), second subparagraph, of Regulation (EU) 2023/1114

Warning: This summary should be read as an introduction to the crypto-asset white paper. The prospective holder should base any decision to purchase this crypto-asset on the content of the crypto-asset white paper as a whole and not on the summary alone. The offer to the public of this crypto-asset does not constitute an offer or solicitation to purchase financial instruments and any such offer or solicitation can be made only by means of a prospectus or other offer documents pursuant to the applicable national law. This crypto-asset white paper does not constitute a prospectus as referred to in Regulation (EU) 2017/1129 of the European Parliament and of the Council or any other offer document pursuant to union or national law.

08. Characteristics of the crypto-asset

The DOLO tokens referred to in this white paper are crypto-assets other than EMTs and ARTs, and are issued on the Ethereum, Arbitrum and Berachain network (2025-09-23 and according to DTI FFG shown in F.14).

The first activity on Ethereum can be viewed on 2025-04-20 (see https://etherscan.io/tx/0x5a79d4db06dbb5f78a1950979cd27e3c9611396f0398591230 a15ca19082dbaa).

The first activity on Arbitrum can be viewed on 2025-04-30 (see

https://arbiscan.io/tx/0x553e8a0c1ad031ab02e92ae4f2581334281893ad39d35bbc70c

a817a4f2c1c38).

The first activity on Berachain can be viewed on 2025-03-28 (see

https://berascan.com/tx/0x364dbcc32c36056768c3790725d5d315715f32d1bdd8acfcb

d8f622677b009ab).

09. Information about the quality and quantity of goods or

services to which the utility tokens give access and restrictions

on the transferability

Not applicable.

10. Key information about the offer to the public or admission to

trading

Crypto Risk Metrics GmbH is seeking admission to trading on any Crypto Asset Service

Provider platform in the European Union in accordance to Article 5 of REGULATION (EU)

2023/1114 OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 31 May 2023 on

markets in crypto-assets, and amending Regulations (EU) No 1093/2010 and (EU) No

1095/2010 and Directives 2013/36/EU and (EU) 2019/1937. In accordance to Article

5(4), this crypto-asset white paper may be used by entities admitting the token to

trading after Crypto Risk Metrics GmbH as the person responsible for drawing up such

white paper has given its consent to its use in writing to the repective Crypto Asset

Service Provider. If a CASP wishes to use this white paper, inquiries can be made under

info@crypto-risk-metrics.com.

Part A – Information about the offeror or the person seeking

13

admission to trading

A.1 Name

Crypto Risk Metrics GmbH

A.2 Legal form

2HBR

A.3 Registered address

DE, Lange Reihe 73, 20099 Hamburg, Germany

A.4 Head office

Not applicable.

A.5 Registration date

2018-12-03

A.6 Legal entity identifier

39120077M9TG0O1FE242

A.7 Another identifier required pursuant to applicable national law

Crypto Risk Metrics GmbH is registered with the commercial register in the the city of Hamburg, Germany, under number HRB 154488.

A.8 Contact telephone number

+4915144974120

A.9 E-mail address

info@crypto-risk-metrics.com

A.10 Response time (Days)

030

A.11 Parent company

Not applicable.

A.12 Members of the management body

| Name | Position | Address |
|------|----------|---------|
| | | |

| Tim Zölitz | Chairman | Lange Reihe 73, 20099 |
|------------|----------|-----------------------|
| | | Hamburg, Germany |

A.13 Business activity

Crypto Risk Metrics GmbH is a technical service provider, who supports regulated entities in the fulfillment of their regulatory requirements. In this regard, Crypto Risk Metrics GmbH acts as a data-provider for ESG-data according to article 66 (5). Due to the regulations laid out in article 5 (4) of the REGULATION (EU) 2023/1114 OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 31 May 2023 on markets in crypto-assets, and amending Regulations (EU) No 1093/2010 and (EU) No 1095/2010 and Directives 2013/36/EU and (EU) 2019/1937, Crypto Risk Metrics GmbH aims at providing central services for crypto-asset white papers in order to minimize market confusion due to conflicting white papers for the same asset.

A.14 Parent company business activity

Not applicable.

A.15 Newly established

Crypto Risk Metrics GmbH has been etablished since 2018 and is therefore not newly established (i. e. older than three years).

A.16 Financial condition for the past three years

Crypto Risk Metrics GmbH's profit after tax for the last three financial years are as follows:

2024 (unaudited): negative 50.891,81 EUR

2023 (unaudited): negative 27.665,32 EUR

2022: 104.283,00 EUR.

As 2023 and 2024 were the years building Software for the MiCAR-Regulation which was not yet in place, revenue streams from these investments are expeted to be generated in 2025.

A.17 Financial condition since registration

This point would only be applicable if the company were newly established and the financial conditions for the past three years had not been provided in the bulletpoint before.

Part B – Information about the issuer, if different from the offeror or person seeking admission to trading

B.1 Issuer different from offeror or person seeking admission to trading

C.14 Reason for drawing the white paper by persons referred to in Article 6(1), second

subparagraph, of Regulation (EU) 2023/1114

Not applicable.

Part D – Information about the crypto-asset project

D.1 Crypto-asset project name

Long Name: "Dolomite", Short Name: "DOLO" according to the Digital Token Identifier

Foundation (www.dtif.org, DTI see F.13, FFG DTI see F.14 as of 2025-09-26).

D.2 Crypto-assets name

See F.13.

D.3 Abbreviation

See F.13.

D.4 Crypto-asset project description

Dolomite is a decentralized finance protocol that provides services in the areas of

lending, borrowing, and margin trading of digital assets. The platform combines money

market functionalities with decentralized exchange mechanisms, enabling users to trade

assets and use them as collateral within the same environment. It is deployed on several

blockchain networks and allows for the integration of a broad range of tokens.

The stated objective of the project is to offer infrastructure for decentralized money

markets and trading, while maintaining token functionalities such as governance or

yield-bearing rights when supplied as collateral. Technical audits have been conducted

on the underlying smart contracts, although no assurance can be given that these

measures eliminate all potential security risks.

As of the date of this white paper, the business activity of Dolomite appears limited to the provision and operation of decentralized financial infrastructure. There is no evidence of broader commercial operations beyond this scope. The long-term sustainability, regulatory treatment, and market acceptance of such activities remain uncertain, and no guarantee can be provided as to their continued availability or development.

D.5 Details of all natural or legal persons involved in the implementation of the cryptoasset project

| Name | Position | Business address |
|--------------------------|--------------------------------------|--|
| Corey Caplan | Director of the Issuer | KY, 10 Market Street, Unit #2476, Camana Bay, Cayman Islands KY19006 |
| Richard Seiler | Director of the Issuer | KY, 10 Market Street, Unit #2476, Camana Bay, Cayman Islands KY19006 |
| Josef Holm | Director of the Issuer | KY, 10 Market Street, Unit #2476, Camana Bay, Cayman Islands KY19006 |
| Dolomite Foundation | Issuer | KY, 10 Market Street, Unit #2476, Camana Bay, Cayman Islands KY19006 |
| Leavitt Innovations, Inc | Involved in the original development | Could not be found while drafting this white paper (2025-09-22). |

D.6 Utility Token Classification

The token does not classify as a utility token.

FFG: G6QFN3Z7F - 2025-10-06

D.7 Key Features of Goods/Services for Utility Token Projects

Not applicable.

D.8 Plans for the token

According to the official documentation (https://docs.dolomite.io/roadmap, accessed

2025-09-30) the Dolomite project has progressed through several milestones since

launch. In October 2022, Dolomite Margin was introduced on Arbitrum One, followed

shortly by the project's participation in Chainlink BUILD in November 2022. Borrow

functionality was added in December 2022, and in early 2023, updates to interest rate

models were implemented to enhance competitiveness. In March 2023, Dolomite

launched a new XP system designed to strengthen community engagement.

Looking ahead, the project emphasizes a community-driven roadmap. Future

development focuses on building cooperative integrations with other decentralized

protocols and expanding the platform's utility with advanced features. The stated

objective is to establish a richer and more comprehensive feature set than currently

available in comparable DeFi money market systems.

It should be noted that the realization of these milestones is subject to ongoing

technological, market, and regulatory uncertainties. No assurance can be provided that

the planned developments will be executed as described or within anticipated

timeframes.

D.9 Resource allocation

According to the official documentation (https://docs.dolomite.io/dolo/distribution,

accessed 2025-09-30), the total supply of the DOLO token amounts to 1,000,000,000

units. At the token generation event, a portion of these tokens was unlocked and

entered circulation, while the remaining supply is subject to staged release mechanisms.

According to the project documentation, 50.75% of the total supply has been allocated

to the community, encompassing sub-categories such as liquidity mining, airdrops,

protocol incentives, partner rewards, and retroactive usage programs. A further 20.21%

has been designated for the core team, reflecting long-term alignment with the project's

development. The foundation has been assigned 10.65% of the supply to support governance and protocol sustainability. Investors collectively hold 15.18% of the allocation, while 3.00% has been allocated to service providers and 0.21% to advisors.

The project specifies that allocations to team members, investors, and service providers are subject to vesting schedules and lock-up periods intended to secure long-term commitment and mitigate short-term concentration risks. Beyond these mechanisms, no guarantee can be given regarding the pace of distribution, the level of community adoption, or the long-term market effects of the allocation.

D.10 Planned use of Collected funds or crypto-Assets

Not applicable, as this white paper was drawn up for the admission to trading and not for collecting funds for the crypto-asset-project.

Part E – Information about the offer to the public of crypto-assets or their admission to trading

E.1 Public offering or admission to trading

The white paper concerns the admission to trading (i. e. ATTR) on any Crypto Asset Service Providers platform that has obtained the written consent of Crypto Risk Metrics GmbH as the person drafting this white paper.

E.2 Reasons for public offer or admission to trading

As already stated in A.13, Crypto Risk Metrics GmbH aims to provide central services to draw up crypto-asset white papers in accordance to COMMISSION IMPLEMENTING REGULATION (EU) 2024/2984. These services are offered in order to minimize market confusion due to conflicting white papers for the same asset drawn up from different Crypto Asset Service Providers. As of now, such a scenario seems highly likely as a Crypto Asset Service Provider who drew up a crypto-asset white paper and admitted the respective token in the Union has no incentive to give his written consent to another Crypto Asset Service Provider according to Article 5 (4 b) of the REGULATION (EU) 2023/1114 to use the white paper for his regulatory obligations, as this would 1.

strenghthen the market-positioning of the other Crypto Asset Service Provider (who is

most likely a competitor) and 2. also entail liability risks.

E.3 Fundraising target

Not applicable, as this white paper is written to support admission to trading and not for

the initial offer to the public.

E.4 Minimum subscription goals

Not applicable, as this white paper is written to support admission to trading and not for

the initial offer to the public.

E.5 Maximum subscription goals

Not applicable, as this white paper is written to support admission to trading and not for

the initial offer to the public.

E.6 Oversubscription acceptance

Not applicable, as this white paper is written to support admission to trading and not for

the initial offer to the public.

E.7 Oversubscription allocation

Not applicable, as this white paper is written to support admission to trading and not for

the initial offer to the public.

E.8 Issue price

Not applicable, as this white paper is written to support admission to trading and not for

the initial offer to the public.

E.9 Official currency or any other crypto-assets determining the issue price

Not applicable, as this white paper is written to support admission to trading and not for

the initial offer to the public.

E.10 Subscription fee

Not applicable, as this white paper is written to support admission to trading and not for

the initial offer to the public.

E.11 Offer price determination method

Once the token is admitted to trading its price will be determined by demand (buyers)

and supply (sellers).

E.12 Total number of offered/traded crypto-assets

The mint authority (the entity who can create new tokens of that crypto-asset), has the

potential right to change the supply of the crypto-assets. The official website confirm,

that the maximum supply is capped at the maximum of 1,000,000,000

(https://docs.dolomite.io/dolo/distribution, accessed 2028-09-28). Investors should note

that changes in the token supply can have a negative impact. The effective amount of

tokens available on the market depends on the number of tokens released by the issuer

or other parties at any given time, as well as potential reductions through token

"burning." As a result, the circulating supply may differ from the total supply.

E.13 Targeted holders

ALL

E.14 Holder restrictions

The Holder restrictions are subject to the rules applicable to the Crypto Asset Service

Provider as well as additional restrictions the Crypto Asset Service Providers might set in

force.

E.15 Reimbursement notice

Not applicable, as this white paper is written to support admission to trading and not for

the initial offer to the public.

E.16 Refund mechanism

Not applicable, as this white paper is written to support admission to trading and not for

the initial offer to the public.

E.17 Refund timeline

Not applicable, as this white paper is written to support admission to trading and not for

the initial offer to the public.

E.18 Offer phases

Not applicable, as this white paper is written to support admission to trading and not for

the initial offer to the public.

E.19 Early purchase discount

Not applicable, as this white paper is written to support admission to trading and not for

the initial offer to the public.

E.20 Time-limited offer

Not applicable, as this white paper is written to support admission to trading and not for

the initial offer to the public.

E.21 Subscription period beginning

Not applicable, as this white paper is written to support admission to trading and not for

the initial offer to the public.

E.22 Subscription period end

Not applicable, as this white paper is written to support admission to trading and not for

the initial offer to the public.

E.23 Safeguarding arrangements for offered funds/crypto- Assets

Not applicable, as this white paper is written to support admission to trading and not for

the initial offer to the public.

E.24 Payment methods for crypto-asset purchase

The payment methods are subject to the respective capabilities of the Crypto Asset

Service Provider listing the crypto-asset.

E.25 Value transfer methods for reimbursement

Not applicable, as this white paper is written to support admission to trading and not for

the initial offer to the public.

FFG: G6QFN3Z7F - 2025-10-06

E.26 Right of withdrawal

Not applicable, as this white paper is written to support admission to trading and not for

the initial offer to the public.

E.27 Transfer of purchased crypto-assets

The transfer of purchased crypto-assets are subject to the respective capabilities of the

Crypto Asset Service Provider listing the crypto-asset.

E.28 Transfer time schedule

Not applicable, as this white paper is written to support admission to trading and not for

the initial offer to the public.

E.29 Purchaser's technical requirements

The technical requirements that the purchaser is required to fulfil to hold the crypto-

assets of purchased crypto-assets are subject to the respective capabilities of the

Crypto Asset Service Provider listing the crypto-asset.

E.30 Crypto-asset service provider (CASP) name

Not applicable.

E.31 CASP identifier

Not applicable.

E.32 Placement form

Not applicable.

E.33 Trading platforms name

The trading on all MiCAR-compliant trading platforms is sought.

E.34 Trading platforms Market identifier code (MIC)

Not applicable.

E.35 Trading platforms access

This depends on the trading platform listing the asset.

FFG: G6QFN3Z7F - 2025-10-06

E.36 Involved costs

This depends on the trading platform listing the asset. Furthermore, costs may occur for

making transfers out of the platform (i. e. "gas costs" for blockchain network use that

may exceed the value of the crypto-asset itself).

E.37 Offer expenses

Not applicable, as this crypto-asset white paper concerns the admission to trading and

not the offer of the token to the public.

E.38 Conflicts of interest

MiCAR-compliant Crypto Asset Service Providers shall have strong measurements in

place in order to manage conflicts of interests. Due to the broad audience this white-

paper is adressing, potential investors should always check the conflicts of Interest

policy of their respective counterparty.

E.39 Applicable law

Not applicable, as it is referred to on "offer to the public" and in this white-paper, the

admission to trading is sought.

E.40 Competent court

Not applicable, as it is referred to on "offer to the public" and in this white-paper, the

admission to trading is sought.

Part F – Information about the crypto-assets

F.1 Crypto-asset type

The crypto-asset described in the white paper is classified as a crypto-asset under the

Markets in Crypto-Assets Regulation (MiCAR) but does not qualify as an electronic

money token (EMT) or an asset-referenced token (ART). It is a digital representation of

value that can be stored and transferred using distributed ledger technology (DLT) or

similar technology, without embodying or conferring any rights to its holder.

FFG: G6QFN3Z7F - 2025-10-06

The asset does not aim to maintain a stable value by referencing an official currency, a

basket of assets, or any other underlying rights. Instead, its valuation is entirely market-

driven, based on supply and demand dynamics, and not supported by a stabilization

mechanism. It is neither pegged to any fiat currency nor backed by any external assets,

distinguishing it clearly from EMTs and ARTs.

Furthermore, the crypto-asset is not categorized as a financial instrument, deposit,

insurance product, pension product, or any other regulated financial product under EU

law. It does not grant financial rights, voting rights, or any contractual claims to its

holders, ensuring that it remains outside the scope of regulatory frameworks applicable

to traditional financial instruments.

F.2 Crypto-asset functionality

The DOLO token serves as the native token within the Dolomite ecosystem. Its primary

functions include enabling participation in governance processes, incentivizing liquidity

provision, and supporting protocol-related reward mechanisms. Through governance,

token holders are able to propose and vote on decisions affecting the evolution of the

platform, subject to the rules defined by the protocol's governance framework.

In addition, DOLO is integrated into the economic design of the system by rewarding

users who contribute to liquidity mining, staking, or other incentive programs. The token

may also be used in connection with fee reductions, access to protocol features, or

participation in incentive schemes designed to promote user engagement and

ecosystem growth.

It should be noted that the functionality of the token is dependent on the continued

operation of the Dolomite protocol, the adoption of its features by the community, and

the maintenance of its underlying smart contract infrastructure. As with all blockchain-

based systems, there is no guarantee that the stated functionalities will be sustained,

and changes in market conditions, regulatory frameworks, or protocol governance may

affect the utility of the token over time.

F.3 Planned application of functionalities

See D.8.

FFG: G6QFN3Z7F - 2025-10-06

A description of the characteristics of the crypto asset, including the

data necessary for classification of the crypto-asset white paper in the

register referred to in Article 109 of Regulation (EU) 2023/1114, as

specified in accordance with paragraph 8 of that Article

F.4 Type of crypto-asset white paper

The white paper type is "other crypto-assets" (i. e. "OTHR").

F.5 The type of submission

The white paper submission type is "NEWT", which stands for new token.

F.6 Crypto-asset characteristics

The tokens are crypto-assets other than EMTs and ARTs, which are available on the

Ethereum, Arbitrum and Berachain blockchain. The tokens are fungible (up to 18 digits

on after the decimal point). The tokens are a digital representation of value, and have no

inherent rights attached as well as no intrinsic utility.

F.7 Commercial name or trading name

See F.13.

F.8 Website of the issuer

https://dolomite.io/

F.9 Starting date of offer to the public or admission to trading

2025-11-03

F.10 Publication date

2025-11-03

F.11 Any other services provided by the issuer

It is not possible to exclude a possibility that the issuer of the token provides or will

provide other services not covered by Regulation (EU) 2023/1114 (i.e. MiCAR).

FFG: G6QFN3Z7F - 2025-10-06

F.12 Language or languages of the crypto-asset white paper

ΕN

F.13 Digital token identifier code used to uniquely identify the crypto-asset or each of the several crypto assets to which the white paper relates, where available

X9CHQ3TZC; BH7750TV2; X38VJD3RN

F.14 Functionally fungible group digital token identifier, where available

G60FN3Z7F

F.15 Voluntary data flag

Mandatory.

F.16 Personal data flag

The white paper does contain personal data.

F.17 LEI eligibility

The issuer should be eligible for a Legal Entity Identifier.

F.18 Home Member State

Germany

F.19 Host Member States

Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden

Part G – Information on the rights and obligations attached to the crypto-assets

G.1 Purchaser rights and obligations

There are no rights or obligations attached for/of the purchaser.

G.2 Exercise of rights and obligations

As the token grants neither rights nor obligations, there are no procedures and conditions for the exercise of these rights applicable.

G.3 Conditions for modifications of rights and obligations

As the token grants neither rights nor obligations, there are no conditions under which the rights and obligations may be modified applicable. An adjustment of the technical infrastructure necessary to exercise the promised governance rights, declining functionality due to dilution, changing rights within the voting platforms, and all other adverse effects for investors may occur at any time.

G.4 Future public offers

Information on the future offers to the public of crypto-assets were not available at the time of writing this white paper (2025-09-28).

G.5 Issuer retained crypto-assets

According to the official documentation (https://docs.dolomite.io/dolo/distribution, accessed 2025-09-30), the total supply of the DOLO token amounts to 1,000,000,000 units. At the token generation event, a portion of these tokens was unlocked and entered circulation, while the remaining supply is subject to staged release mechanisms.

According to the project documentation, 50.75% of the total supply has been allocated to the community, encompassing sub-categories such as liquidity mining, airdrops, protocol incentives, partner rewards, and retroactive usage programs. A further 20.21% has been designated for the core team, reflecting long-term alignment with the project's development. The foundation has been assigned 10.65% of the supply to support governance and protocol sustainability. Investors collectively hold 15.18% of the allocation, while 3.00% has been allocated to service providers and 0.21% to advisors.

In a broader sense, approximately 34.07% of the total token supply (comprising allocations to the core team, the foundation, service providers, and advisors) may be considered issuer retained, although these tokens are subject to governance structures and vesting mechanisms, and are not all directly held or controlled by the issuer.

31

The project specifies that allocations to team members, investors, and service providers

are subject to vesting schedules and lock-up periods intended to secure long-term

commitment and mitigate short-term concentration risks. Beyond these mechanisms,

no guarantee can be given regarding the pace of distribution, the level of community

adoption, or the long-term market effects of the allocation.

G.6 Utility token classification

No

G.7 Key features of goods/services of utility tokens

Not applicable.

G.8 Utility tokens redemption

Not applicable.

G.9 Non-trading request

The admission to trading is sought.

G.10 Crypto-assets purchase or sale modalities

Not applicable, as this white paper is written to support admission to trading and not for

the initial offer to the public.

G.11 Crypto-assets transfer restrictions

The crypto-assets as such do not have any transfer restrictions and are generally freely

transferable. The Crypto Asset Service Providers can impose their own restrictions in

agreements they enter with their clients. The Crypto Asset Service Providers may

impose restrictions to buyers and sellers in accordance with applicable laws and internal

policies and terms.

G.12 Supply adjustment protocols

No, there are no fixed protocols that can increase or decrease the supply implemented

as of 2025-09-19. Also, it is possible to decrease the circulating supply, by transferring

FFG: G6QFN3Z7F - 2025-10-06

crypto-assets to so called "burn-addresses", which are addresses that render the

crypto-asset "non-transferable" after sent to those addresses.

G.13 Supply adjustment mechanisms

The mint authority (the entity who can create new tokens of that crypto-asset), has the

potential right to change the supply of the crypto-assets. The official website confirm,

that the maximum supply is capped at the maximum of 1,000,000,000

(https://docs.dolomite.io/dolo/distribution, accessed 2028-09-28). Investors should note

that changes in the token supply can have a negative impact.

G.14 Token value protection schemes

No, the token does not have value protection schemes.

G.15 Token value protection schemes description

Not applicable.

G.16 Compensation schemes

No, the token does not have compensation schemes.

G.17 Compensation schemes description

Not applicable.

G.18 Applicable law

Applicable law likely depends on the location of any particular transaction with the

token.

G.19 Competent court

Competent court likely depends on the location of any particular transaction with the

token.

FFG: G6QFN3Z7F - 2025-10-06

Part H – information on the underlying technology

H.1 Distributed ledger technology (DTL)

See F.13.

H.2 Protocols and technical standards

The crypto asset that is the subject of this white paper is available on multiple DLT

networks. These include: Ethereum, Arbitrum and Berachain. In general, when

evaluating crypto assets, the total number of tokens issued across different networks

must always be taken into account, as spillover effects can be adverse for investors.

The following applies to Ethereum:

The crypto-asset operates on a well-defined set of protocols and technical standards

that are intended to ensure its security, decentralization, and functionality. It is running

on the Ethereum blockchain. Below are some of the key ones:

1. Network Protocols

The crypto-asset follows a decentralized, peer-to-peer (P2P) protocol where nodes

communicate over the crypto-asset's DevP2P protocol using RLPx for data encoding.

- Transactions and smart contract execution are secured through Proof-of-Stake (PoS)

consensus.

- Validators propose and attest blocks in Ethereum's Beacon Chain, finalized through

Casper FFG.

- The Ethereum Virtual Machine (EVM) executes smart contracts using Turing-complete

bytecode.

2. Transaction and Address Standards

crypto-asset Address Format: 20-byte addresses derived from Keccak-256 hashing of

public keys.

Transaction Types:

FFG: G6QFN3Z7F - 2025-10-06

- Legacy Transactions (pre-EIP-1559)

- Type 0 (Pre-EIP-1559 transactions)

- Type 1 (EIP-2930: Access list transactions)

- Type 2 (EIP-1559: Dynamic fee transactions with base fee burning)

The Pectra upgrade introduces EIP-7702, a transformative improvement to account

abstraction. This allows externally owned accounts (EOAs) to temporarily act as smart

contract wallets during a transaction. It provides significant flexibility, enabling

functionality such as sponsored gas payments and batched operations without

changing the underlying account model permanently.

3. Blockchain Data Structure & Block Standards

- the crypto-asset's blockchain consists of accounts, smart contracts, and storage states,

maintained through Merkle Patricia Trees for efficient verification.

Each block contains:

- Block Header: Parent hash, state root, transactions root, receipts root, timestamp, gas

limit, gas used, proposer signature.

- Transactions: Smart contract executions and token transfers.

- Block Size: No fixed limit; constrained by the gas limit per block (variable over time). In

line with Ethereum's scalability roadmap, Pectra includes EIP-7691, which increases the

maximum number of "blobs" (data chunks introduced with EIP-4844) per block. This

change significantly boosts the data availability layer used by rollups, supporting

cheaper and more efficient Layer 2 scalability.

4. Upgrade & Improvement Standards

Ethereum follows the Ethereum Improvement Proposal (EIP) process for upgrades.

35

The following applies to Arbitrum:

Arbitrum commonly refers to the Arbitrum Rollup, a Layer 2 (L2) blockchain build using

the Arbitrum technology suite. The Arbitrum Rollup is an optimistic rollup on top of the

Ethereum blockchain. This means that the L2 transactions do not have their own

consensus mechanism and are only validated by the execution clients. The so-called

sequencer regularly bundles stacks of L2 transactions and publishes them on the L1

network, i.e. Ethereum. Ethereum's consensus mechanism (Proof-of-Stake) thus

indirectly secures all L2 transactions as soon as they are written to L1.

The following applies to Berachain:

n Berachain, the crypto-asset operates within a Cosmos SDK-based environment that

integrates Ethereum Virtual Machine (EVM) compatibility. Transactions follow a peer-to-

peer protocol secured through CometBFT consensus, and addresses use standard

Ethereum-style 20-byte Keccak-256 formats. Smart contracts are executed via the EVM,

ensuring interoperability with Ethereum tooling.

H.3 Technology used

The crypto asset that is the subject of this white paper is available on multiple DLT

networks. These include: Ethereum, Arbitrum and Berachain. In general, when

evaluating crypto assets, the total number of tokens issued across different networks

must always be taken into account, as spillover effects can be adverse for investors.

The following applies to Ethereum:

Decentralized Ledger: The Ethereum blockchain acts as a decentralized ledger for all

token transactions, with the intention to preserving an unalterable record of token

transfers and ownership to ensure both transparency and security.

2. Private Key Management: To safeguard their token holdings, users must securely

store their wallet's private keys and recovery phrases.

FFG: G6QFN3Z7F - 2025-10-06

3. Cryptographic Integrity: Ethereum employs elliptic curve cryptography to validate and

execute transactions securely, intended to ensure the integrity of all transfers. The

Keccak-256 (SHA-3 variant) Hashing Algorithm is used for hashing and address

generation. The crypto-asset uses ECDSA with secp256k1 curve for key generation and

digital signatures. Next to that, BLS (Boneh-Lynn-Shacham) signatures are used for

validator aggregation in PoS.

The following applies to Arbitrum:

1. Arbitrum-Compatible Wallets:The tokens are supported by all wallets compatible with

the Ethereum Virtual Machine (EVM), such as MetaMask and OKX Wallet.

2. Decentralized Ledger: Arbitrum operates as a Layer-2 blockchain on Ethereum and

maintains its own decentralized ledger for recording token transactions. Final

transaction data is periodically posted to Ethereum Layer 1, ensuring long-term

availability and resistance to tampering.

3. ERC-20 Token Standard: The Arbitrum network supports tokens implemented under

the ERC-20 standard, the same as on Ethereum.

4. Arbitrum supports what is called. MultiVM, which is the combination of EVM support

and WASM VM support. The latter one being more efficient (lower gas costs) but specific

to Arbitrum.

5. Scalability and Transaction Efficiency:

As a rollup-based Layer-2, Arbitrum is intended to handle high volumes of transactions

with lower fees compared to Ethereum Layer 1. This is enabled by off-chain execution

and on-chain data posting via optimistic rollup architecture.

The following applies to Berachain:

Berachain employs a modular architecture with Merkle Patricia Trees for state

management and governance-driven protocol upgrade mechanisms. The chain

FFG: G6QFN3Z7F - 2025-10-06

supports standard Ethereum transaction types (legacy and EIP-1559) and maintains

block parameters such as gas limits and validator signatures. These technical features

are designed to provide compatibility with Ethereum while enabling scalability

enhancements.

H.4 Consensus mechanism

The crypto asset that is the subject of this white paper is available on multiple DLT

networks. These include: Ethereum, Arbitrum and Berachain. In general, when

evaluating crypto assets, the total number of tokens issued across different networks

must always be taken into account, as spillover effects can be adverse for investors.

The following applies to Ethereum:

The crypto-asset's Proof-of-Stake (PoS) consensus mechanism, introduced with The

Merge in 2022, replaces mining with validator staking. Validators must stake at least 32

ETH every block a validator is randomly chosen to propose the next block. Once

proposed the other validators verify the blocks integrity. The network operates on a slot

and epoch system, where a new block is proposed every 12 seconds, and finalization

occurs after two epochs (~12.8 minutes) using Casper-FFG. The Beacon Chain

coordinates validators, while the fork-choice rule (LMD-GHOST) ensures the chain

follows the heaviest accumulated validator votes. Validators earn rewards for proposing

and verifying blocks, but face slashing for malicious behavior or inactivity. PoS aims to

improve energy efficiency, security, and scalability, with future upgrades like Proto-

Danksharding enhancing transaction efficiency.

The following applies to Arbitrum:

Arbitrum is a Layer-2 (L2) solution on Ethereum that is developed using the Arbitrum

technology suite. L2 transactions do not have their own consensus mechanism and are

only validated by the execution clients. The so-called sequencer regularly bundles stacks

of L2 transactions and publishes them on the L1 network, i.e. Ethereum. Ethereum's

FFG: G6QFN3Z7F - 2025-10-06

consensus mechanism (Proof-of-Stake) thus indirectly secures all L2 transactions as

soon as they are written to L1.

The following applies to Berachain:

Berachain uses a variant of the CometBFT (Tendermint) Byzantine Fault Tolerant

consensus. Validators propose and finalize blocks through a two-thirds majority voting

process. This mechanism is intended to provide fault tolerance and consistency, though

as a comparatively new approach it carries risks regarding operational stability and long-

term security.

H.5 Incentive mechanisms and applicable fees

The crypto asset that is the subject of this white paper is available on multiple DLT

networks. These include: Ethereum, Arbitrum and Berachain. In general, when

evaluating crypto assets, the total number of tokens issued across different networks

must always be taken into account, as spillover effects can be adverse for investors.

The following applies to Ethereum:

The crypto-asset's PoS system secures transactions through validator incentives and

economic penalties. Validators stake at least 32 ETH and earn rewards for proposing

blocks, attesting to valid ones, and participating in sync committees. Rewards are paid in

newly issued ETH and transaction fees. Under EIP-1559, transaction fees consist of a

base fee, which is burned to reduce supply, and an optional priority fee (tip) paid to

validators. Validators face slashing if they act maliciously and incur penalties for

inactivity. This system aims to increase security by aligning incentives while making the

crypto-asset's fee structure more predictable and deflationary during high network

activity.

The following applies to Arbitrum:

FFG: G6QFN3Z7F - 2025-10-06

Arbitrum is a Layer-2 (L2) solution on Ethereum that is developed using the Arbitrum

technology suite. Transaction on Arbitrum are bundled by a, so called, sequencer and

the result is regularly submitted as an Layer-1 (L1) transactions. This way many L2

transactions get combined into a single L1 transaction. This lowers the average

transaction cost per transaction, because many L2 transactions together fund the

transaction cost for the single L1 transaction. This creates incentives to use Arbitrum

rather than the L1, i.e. Ethereum, itself. To get crypto-assets in and out of Arbitrum, a

special smart contract on Ethereum is used. Since there is no consensus mechanism on

L2 an additional mechanism ensures that only existing funds can be withdrawn from L2.

When a user wants to withdraw funds, that user needs to submit a withdrawal request

on L1. If this request remains undisputed for a period of time the funds can be

withdrawn. During this time period Arbitrum validators can dispute the claim, which will

start a dispute resolution process. This process is designed with economic incentives for

correct behavior of all participants.

The following applies to Berachain:

Transactions and smart contract executions on Berachain require gas fees

denominated in the network's native unit. Fees are structured to compensate validators

for block production and resource usage, with a portion of base fees burned in line with

EIP-1559-style mechanics. Storage and smart contract execution fees are also applied to

manage resource efficiency.

H.6 Use of distributed ledger technology

No, DLT is neither operated by the issuer nor a third party acting on the issuer's behalf.

H.7 DLT functionality description

Not applicable.

H.8 Audit

As we are understanding the question relating to "technology" to be interpreted in a

broad sense, the answer answer to whether an audit of "the technology used" was

FFG: G6QFN3Z7F - 2025-10-06

conducted is "no, we can not guarantee, that all parts of the technology used have been

audited". This is due to the fact this report focusses on risk, and we can not guarantee

that each part of the technology used was audited.

H.9 Audit outcome

Not applicable.

Part I - Information on risks

I.1 Offer-related risks

1. Regulatory and Compliance

This white paper has been prepared with utmost caution; however, uncertainties in the

regulatory requirements and future changes in regulatory frameworks could potentially

impact the token's legal status and its tradability. There is also a high probability that

other laws will come into force, changing the rules for the trading of the token.

Therefore, such developments shall be monitored and acted upon accordingly.

2. Operational and Technical

Blockchain Dependency: The token is entirely dependent on the blockchain the crypto-

asset is issued upon. Any issues, such as downtime, congestion, or security

vulnerabilities within the blockchain, could adversely affect the token's functionality.

Smart Contract Risks: Smart contracts governing the token may contain hidden

vulnerabilities or bugs that could disrupt the token offering or distribution processes.

Connection Dependency: As the trading of the token also involves other trading venues,

technical risks such as downtime of the connection or faulty code are also possible.

Human errors: Due to the irrevocability of blockchain-transactions, approving wrong

transactions or using incorrect networks/addresses will most likely result in funds not

being accessibly anymore.

FFG: G6QFN3Z7F - 2025-10-06

Custodial risk: When admitting the token to trading, the risk of losing clients assets due

to hacks or other malicious acts is given. This is due to the fact the token is hold in

custodial wallets for the customers.

3. Market and Liquidity

Volatility: The token will most likely be subject to high volatility and market speculation.

Price fluctuations could be significant, posing a risk of substantial losses to holders.

Liquidity Risk: Liquidity is contingent upon trading activity levels on decentralized

exchanges (DEXs) and potentially on centralized exchanges (CEXs), should they be

involved. Low trading volumes may restrict the buying and selling capabilities of the

tokens.

4. Counterparty

As the admission to trading involves the connection to other trading venues,

counterparty risks arise. These include, but are not limited to, the following risks:

General Trading Platform Risk: The risk of trading platforms not operating to the highest

standards is given. Examples like FTX show that especially in nascent industries,

compliance and oversight-frameworks might not be fully established and/or enforced.

Listing or Delisting Risks: The listing or delisting of the token is subject to the trading

partners internal processes. Delisting of the token at the connected trading partners

could harm or completely halt the ability to trade the token.

5. Liquidity

Liquidity of the token can vary, especially when trading activity is limited. This could

result in high slippage when trading a token.

6. Failure of one or more Counterparties

Another risk stems from the internal operational processes of the counterparties used.

As there is no specific oversight other than the typical due diligence check, it cannot be

guaranteed that all counterparties adhere to the best market standards.

FFG: G6QFN3Z7F - 2025-10-06

Bankruptcy Risk: Counterparties could go bankrupt, possibly resulting in a total loss for

the clients assets hold at that counterparty.

7. Information asymmetry

Different groups of participants may not have the same access to technical details or

governance information, leading to uneven decision-making and potential

disadvantages for less informed investors.

I.2 Issuer-related risks

1. Insolvency

As with every other commercial endeavor, the risk of insolvency of entities involved in

the project is given. This could be caused by but is not limited to lack of interest from

the public, lack of funding, incapacitation of key developers and project members, force

majeure (including pandemics and wars) or lack of commercial success or prospects.

2. Counterparty

In order to operate, entities involved in the project have most likely engaged in different

business relationships with one or more third parties on which they and the network

strongly depend on. Loss or changes in the leadership or key partners of entities

involved in the project and/or the respective counterparties can lead to disruptions, loss

of trust, or project failure. This could result in a total loss of economic value for the

crypto-asset holders.

3. Legal and Regulatory Compliance

Cryptocurrencies and blockchain-based technologies are subject to evolving regulatory

landscapes worldwide. Regulations vary across jurisdictions and may be subject to

significant changes. Non-compliance can result in investigations, enforcement actions,

penalties, fines, sanctions, or the prohibition of the trading of the crypto-asset impacting

its viability and market acceptance. This could also result in entities involved in the

project to be subject to private litigation. The aforeementioned would most likely also

lead to changes with respect to trading of the crypto-asset that may negatively impact

the value, legality, or functionality of the crypto-asset.

4. Operational

Failure to develop or maintain effective internal control, or any difficulties encountered

in the implementation of such controls, or their improvement could harm the business,

causing disruptions, financial losses, or reputational damage of entities involved in the

project.

5. Industry

The network and all entities involved in the project are and will be subject to all of the

risks and uncertainties associated with a crypto-project, where the token issued has

zero intrinsic value. History has shown that most of this projects resulted in financial

losses for the investors and were only set-up to enrich a few insiders with the money

from retail investors.

6. Reputational

The network and all entities involved in the project face the risk of negative publicity,

whether due to, without limitation, operational failures, security breaches, or association

with illicit activities, which can damage the reputation of the network and all entities

involved in the project and, by extension, the value and acceptance of the crypto-asset.

7. Competition

There are numerous other crypto-asset projects in the same realm, which could have an

effect on the crypto-asset in question.

8. Unanticipated Risk

In addition to the risks included in this section, there might be other risks that cannot be

foreseen. Additional risks may also materialize as unanticipated variations or

combinations of the risks discussed.

I.3 Crypto-assets-related risks

1. Valuation

As the crypto-asset does not have any intrinsic value, and grants neither rights nor

obligations, the only mechanism to determine the price is supply and demand.

Historically, most crypto-assets have dramatically lost value and were not a beneficial

investment for the investors. Therefore, investing in these crypto-assets poses a high

risk, and the loss of funds can occur.

2. Market Volatility

Crypto-asset prices are highly susceptible to dramatic fluctuations influence by various

factors, including market sentiment, regulatory changes, technological advancements,

and macroeconomic conditions. These fluctuations can result in significant financial

losses within short periods, making the market highly unpredictable and challenging for

investors. This is especially true for crypto-assets without any intrinsic value, and

investors should be prepared to lose the complete amount of money invested in the

respective crypto-assets.

3. Liquidity Challenges

Some crypto-assets suffer from limited liquidity, which can present difficulties when

executing large trades without significantly impacting market prices. This lack of liquidity

can lead to substantial financial losses, particularly during periods of rapid market

movements, when selling assets may become challenging or require accepting

unfavorable prices.

4. Asset Security

Crypto-assets face unique security threats, including the risk of theft from exchanges or

digital wallets, loss of private keys, and potential failures of custodial services. Since

crypto transactions are generally irreversible, a security breach or mismanagement can

result in the permanent loss of assets, emphasizing the importance of strong security

measures and practices.

5. Scams

The irrevocability of transactions executed using blockchain infrastructure, as well as the

pseudonymous nature of blockchain ecosystems, attracts scammers. Therefore,

investors in crypto-assets must proceed with a high degree of caution when investing in

if they invest in crypto-assets. Typical scams include - but are not limited to - the

FFG: G6QFN3Z7F - 2025-10-06

creation of fake crypto-assets with the same name, phishing on social networks or by email, fake giveaways/airdrops, identity theft, among others.

6. Blockchain Dependency

Any issues with the blockchain used, such as network downtime, congestion, or security vulnerabilities, could disrupt the transfer, trading, or functionality of the crypto-asset.

7. Smart Contract Vulnerabilities

The smart contract used to issue the crypto-asset could include bugs, coding errors, or vulnerabilities which could be exploited by malicious actors, potentially leading to asset loss, unauthorized data access, or unintended operational consequences.

8. Privacy Concerns

All transactions on the blockchain are permanently recorded and publicly accessible, which can potentially expose user activities. Although addresses are pseudonoymous, the transparent and immutable nature of blockchain allows for advanced forensic analysis and intelligence gathering. This level of transparency can make it possible to link blockchain addresses to real-world identities over time, compromising user privacy.

9. Regulatory Uncertainty

The regulatory environment surrounding crypto-assets is constantly evolving, which can directly impact their usage, valuation, and legal status. Changes in regulatory frameworks may introduce new requirements related to consumer protection, taxation, and anti-money laundering compliance, creating uncertainty and potential challenges for investors and businesses operating in the crypto space. Although the crypto-asset do not create or confer any contractual or other obligations on any party, certain regulators may nevertheless qualify the crypto-asset as a security or other financial instrument under their applicable law, which in turn would have drastic consequences for the crypto-asset, including the potential loss of the invested capital in the asset. Furthermore, this could lead to the sellers and its affiliates, directors, and officers being obliged to pay fines, including federal civil and criminal penalties, or make the crypto-asset illegal or impossible to use, buy, or sell in certain jurisdictions. On top of that,

FFG: G6QFN3Z7F - 2025-10-06

regulators could take action against the network and all entities involved in the project

as well as the trading platforms if the the regulators view the token as an unregistered

offering of securities or the operations otherwise as a violation of existing law. Any of

these outcomes would negatively affect the value and/or functionality of the crypot-

asset and/or could cause a complete loss of funds of the invested money in the crypto-

asset for the investor.

10. Counterparty risk

Engaging in agreements or storing crypto-assets on exchanges introduces counterparty

risks, including the failure of the other party to fulfill their obligations. Investors may face

potential losses due to factors such as insolvency, regulatory non-compliance, or

fraudulent activities by counterparties, highlighting the need for careful due diligence

when engaging with third parties.

11. Reputational concerns

Crypto-assets are often subject to reputational risks stemming from associations with

illegal activities, high-profile security breaches, and technological failures. Such incidents

can undermine trust in the broader ecosystem, negatively affecting investor confidence

and market value, thereby hindering widespread adoption and acceptance.

12. Technological Innovation

New technologies or platforms could render the network's design less competitive or

even break fundamental parts (i.e., quantum computing might break cryptographic

algorithms used to secure the network), impacting adoption and value. Participants

should approach the crypto-asset with a clear understanding of its speculative and

volatile nature and be prepared to accept these risks and bear potential losses, which

could include the complete loss of the asset's value.

13. Community and Narrative

As the crypto-asset has no intrinsic value, all trading activity is based on the intended

market value is heavily dependent on its community.

14. Interest Rate Change

FFG: G6QFN3Z7F - 2025-10-06

Historically, changes in interest, foreign exchange rates, and increases in volatility have

increased credit and market risks and may also affect the value of the crypto-asset.

Although historic data does not predict the future, potential investors should be aware

that general movements in local and other factors may affect the market, and this could

also affect market sentiment and, therefore most likely also the price of the crypto-

asset.

15. Taxation

The taxation regime that applies to the trading of the crypto-asset by individual holders

or legal entities will depend on the holder's jurisdiction. It is the holder's sole

responsibility to comply with all applicable tax laws, including, but not limited to, the

reporting and payment of income tax, wealth tax, or similar taxes arising in connection

with the appreciation and depreciation of the crypto-asset.

16. Anti-Money Laundering/Counter-Terrorism Financing

It cannot be ruled out that crypto-asset wallet addresses interacting with the crypto-

asset have been, or will be used for money laundering or terrorist financing purposes,

or are identified with a person known to have committed such offenses.

17. Market Abuse

It is noteworthy that crypto-assets are potentially prone to increased market abuse

risks, as the underlying infrastructure could be used to exploit arbitrage opportunities

through schemes such as front-running, spoofing, pump-and-dump, and fraud across

different systems, platforms, or geographic locations. This is especially true for crypto-

assets with a low market capitalization and few trading venues, and potential investors

should be aware that this could lead to a total loss of the funds invested in the crypto-

asset.

18. Timeline and Milestones

Critical project milestones could be delayed by technical, operational, or market

challenges.

FFG: G6QFN3Z7F - 2025-10-06

19. Legal ownership: Depending on jurisdiction, token holders may not have

enforceable legal rights over their holdings, limiting avenues for recourse in disputes or

cases of fraud.

20. Jurisdictional blocking: Access to exchanges, wallets, or interfaces may be restricted

based on user location or regulatory measures, even if the token remains transferable

on-chain.

21. Token concentration: A large proportion of tokens held by a few actors could allow

price manipulation, governance dominance, or sudden sell-offs impacting market

stability.

22. Ecosystem incentive misalignment: If validator, developer, or user rewards become

unattractive or distorted, network security and participation could decline.

23. Governance deadlock: Poorly structured or fragmented governance processes may

prevent timely decisions, creating delays or strategic paralysis.

24. Compliance misalignment: Features or delivery mechanisms may unintentionally

conflict with evolving regulations, particularly regarding consumer protection or data

privacy.

I.4 Project implementation-related risks

As this white paper relates to the "Admission to trading" of the crypto-asset, the

implementation risk is referring to the risks on the Crypto Asset Service Providers side.

These can be, but are not limited to, typical project management risks, such as key-

personal-risks, timeline-risks, and technical implementation-risks.

I.5 Technology-related risks

As this white paper relates to the "Admission to trading" of the crypto-asset, the

technology-related risks mainly involve the DLT networks where the crypto asset is

issued in.

1. Blockchain Dependency Risks

FFG: G6QFN3Z7F - 2025-10-06

Network Downtime: Potential outages or congestion on the involved blockchains could

interrupt on-chain token transfers, trading, and other functions.

2. Smart Contract Risks

Vulnerabilities: The smart contract governing the token could contain bugs or

vulnerabilities that may be exploited, affecting token distribution or vesting schedules.

3. Wallet and Storage Risks

Private Key Management: Token holders must securely manage their private keys and

recovery phrases to prevent permanent loss of access to their tokens, which includes

Trading-Venues, who are a prominent target for dedicated hacks.

Compatibility Issues: The tokens require compatible wallets for storage and transfer. Any

incompatibility or technical issues with these wallets could impact token accessibility.

4. Network Security Risks

Attack Risks: The blockchains may face threats such as denial-of-service (DoS) attacks or

exploits targeting its consensus mechanism, which could compromise network integrity.

Centralization Concerns: Although claiming to be decentralized, the relatively smaller

number of validators/concentration of stakes within the networks compared to other

blockchains might pose centralization risks, potentially affecting network resilience.

5. Evolving Technology Risks: Technological Obsolescence: The fast pace of innovation in

blockchain technology may make the used token standard appear less competitive or

become outdated, potentially impacting the usability or adoption of the token.

6. Bridges: The dependency on multiple ecosystems can negatively impact investors.

This asset bridge creates corresponding risks for investors, as this lock-in mechanism

may not function properly for technical reasons or may be subject to attack. In that case,

the supply may change immediately or the ownership rights to tokens may be changed.

7. Forking risk: Network upgrades may split the blockchain into separate versions,

potentially creating duplicate tokens or incompatibility between different versions of the

protocol.

FFG: G6QFN3Z7F - 2025-10-06 50

8. Economic abstraction: Mechanisms such as gas relayers or wrapped tokens may allow

users to bypass the native asset, reducing its direct demand and weakening its

economic role.

9. Dust and spam attacks: Low-value transactions may flood the network, increasing

ledger size, reducing efficiency, and exposing user addresses to tracking.

10. Frontend dependency: If users rely on centralised web interfaces or wallets, service

outages or compromises could block access even if the blockchain itself continues to

operate.

I.6 Mitigation measures

None.

Part J - Information on the sustainability indicators in relation to

adverse impact on the climate and other environment-related

adverse impacts

J.1 Adverse impacts on climate and other environment-related adverse impacts

S.1 Name

Crypto Risk Metrics GmbH

S.2 Relevant legal entity identifier

39120077M9TG0O1FE242

S.3 Name of the cryptoasset

Dolomite

S.4 Consensus Mechanism

The crypto asset that is the subject of this white paper is available on multiple DLT

networks. These include: Ethereum, Arbitrum and Berachain. In general, when

evaluating crypto assets, the total number of tokens issued across different networks

must always be taken into account, as spillover effects can be adverse for investors.

FFG: G6QFN3Z7F - 2025-10-06

The following applies to Ethereum:

The crypto-asset's Proof-of-Stake (PoS) consensus mechanism, introduced with The

Merge in 2022, replaces mining with validator staking. Validators must stake at least 32

ETH every block a validator is randomly chosen to propose the next block. Once

proposed the other validators verify the blocks integrity. The network operates on a slot

and epoch system, where a new block is proposed every 12 seconds, and finalization

occurs after two epochs (~12.8 minutes) using Casper-FFG. The Beacon Chain

coordinates validators, while the fork-choice rule (LMD-GHOST) ensures the chain

follows the heaviest accumulated validator votes. Validators earn rewards for proposing

and verifying blocks, but face slashing for malicious behavior or inactivity. PoS aims to

improve energy efficiency, security, and scalability, with future upgrades like Proto-

Danksharding enhancing transaction efficiency.

The following applies to Arbitrum:

Arbitrum is a Layer-2 (L2) solution on Ethereum that is developed using the Arbitrum

technology suite. L2 transactions do not have their own consensus mechanism and are

only validated by the execution clients. The so-called sequencer regularly bundles stacks

of L2 transactions and publishes them on the L1 network, i.e. Ethereum. Ethereum's

consensus mechanism (Proof-of-Stake) thus indirectly secures all L2 transactions as

soon as they are written to L1.

The following applies to Berachain:

Berachain uses a variant of the CometBFT (Tendermint) Byzantine Fault Tolerant

consensus. Validators propose and finalize blocks through a two-thirds majority voting

process. This mechanism is intended to provide fault tolerance and consistency, though

as a comparatively new approach it carries risks regarding operational stability and long-

term security.

FFG: G6QFN3Z7F - 2025-10-06

S.5 Incentive Mechanisms and Applicable Fees

The crypto asset that is the subject of this white paper is available on multiple DLT networks. These include: Ethereum, Arbitrum and Berachain. In general, when evaluating crypto assets, the total number of tokens issued across different networks must always be taken into account, as spillover effects can be adverse for investors.

The following applies to Ethereum:

The crypto-asset's PoS system secures transactions through validator incentives and economic penalties. Validators stake at least 32 ETH and earn rewards for proposing blocks, attesting to valid ones, and participating in sync committees. Rewards are paid in newly issued ETH and transaction fees. Under EIP-1559, transaction fees consist of a base fee, which is burned to reduce supply, and an optional priority fee (tip) paid to validators. Validators face slashing if they act maliciously and incur penalties for inactivity. This system aims to increase security by aligning incentives while making the crypto-asset's fee structure more predictable and deflationary during high network activity.

The following applies to Arbitrum:

Arbitrum is a Layer-2 (L2) solution on Ethereum that is developed using the Arbitrum technology suite. Transaction on Arbitrum are bundled by a, so called, sequencer and the result is regularly submitted as an Layer-1 (L1) transactions. This way many L2 transactions get combined into a single L1 transaction. This lowers the average transaction cost per transaction, because many L2 transactions together fund the transaction cost for the single L1 transaction. This creates incentives to use Arbitrum rather than the L1, i.e. Ethereum, itself. To get crypto-assets in and out of Arbitrum, a special smart contract on Ethereum is used. Since there is no consensus mechanism on L2 an additional mechanism ensures that only existing funds can be withdrawn from L2. When a user wants to withdraw funds, that user needs to submit a withdrawal request on L1. If this request remains undisputed for a period of time the funds can be

FFG: G6QFN3Z7F - 2025-10-06

withdrawn. During this time period Arbitrum validators can dispute the claim, which will

start a dispute resolution process. This process is designed with economic incentives for

correct behavior of all participants.

The following applies to Berachain:

Transactions and smart contract executions on Berachain require gas fees

denominated in the network's native unit. Fees are structured to compensate validators

for block production and resource usage, with a portion of base fees burned in line with

EIP-1559-style mechanics. Storage and smart contract execution fees are also applied to

manage resource efficiency.

S.6 Beginning of the period to which the disclosure relates

2024-09-28

S.7 End of the period to which the disclosure relates

2025-09-28

S.8 Energy consumption

482.20110 kWh/a

S.9 Energy consumption sources and methodologies

The energy consumption of this asset is aggregated across multiple components: To

determine the energy consumption of a token, the energy consumption of the network

Ethereum, Berachain and Arbitrum is calculated first. For the energy consumption of the

token, a fraction of the energy consumption of the network is attributed to the token,

which is determined based on the activity of the crypto-asset within the network. When

calculating the energy consumption, the Functionally Fungible Group Digital Token

Identifier (FFG DTI) is used - if available - to determine all implementations of the asset in

scope. The mappings are updated regularly, based on data of the Digital Token Identifier

Foundation. The information regarding the hardware used and the number of

participants in the network is based on assumptions that are verified with best effort

FFG: G6QFN3Z7F - 2025-10-06

using empirical data. In general, participants are assumed to be largely economically rational. As a precautionary principle, we make assumptions on the conservative side when in doubt, i.e. making higher estimates for the adverse impacts.

S.10 Renewable energy consumption

32.2255486008 %

S.11 Energy intensity

0.00007 kWh

S.12 Scope 1 DLT GHG emissions - Controlled

0.00000 tCO2e/a

S.13 Scope 2 DLT GHG emissions – Purchased

0.16048 tCO2e/a

S.14 GHG intensity

0.00002 kgCO2e

S.15 Key energy sources and methodologies

To determine the proportion of renewable energy usage, the locations of the nodes are to be determined using public information sites, open-source crawlers and crawlers developed in-house. If no information is available on the geographic distribution of the nodes, reference networks are used which are comparable in terms of their incentivization structure and consensus mechanism. This geo-information is merged with public information from Our World in Data, see citation. The intensity is calculated as the marginal energy cost wrt. one more transaction. Ember (2025); Energy Institute -Statistical Review of World Energy (2024) - with major processing by Our World in Data. "Share of electricity generated by renewables - Ember and Energy Institute" [dataset]. Ember, "Yearly Electricity Data Europe"; Ember, "Yearly Electricity Data"; Energy Institute, "Statistical Review of World Energy" Retrieved [original data]. from https://ourworldindata.org/grapher/share-electricity-renewables.

FFG: G6QFN3Z7F - 2025-10-06 55

S.16 Key GHG sources and methodologies

To determine the GHG Emissions, the locations of the nodes are to be determined using public information sites, open-source crawlers and crawlers developed in-house.
